

Pari Malik — Portfolio Project Report

Quillance Full Stack & Web Development • Individual Full Stack Mini Project • Duration: 2 Days

1. Objective & Selected Technology

The objective is to build a complete responsive developer portfolio that professionally presents Pari Malik's profile, technical skills, education, projects, certification and current Full Stack Development internship. The site also provides a downloadable resume, social links and a contact workflow backed by an API and database.

- Frontend: HTML5, CSS3 and vanilla JavaScript
- Backend: Node.js with Express.js
- Database: MongoDB Atlas with Mongoose
- Version control: Git and GitHub
- Deployment target: Vercel/Netlify for the frontend and Render/Railway for the backend

2. Features & Portfolio Content

- Responsive Home and navigation section with primary calls to action
- About Me section describing current study and learning focus
- Technical Skills grouped by frontend, backend, programming, database, AI/computer vision and tools
- Education: B.E. Computer Engineering, Rajiv Gandhi Institute of Technology, Mumbai — 3rd Year, 5th Semester
- Experience: Full Stack Development Intern at Quillance Infotech Pvt. Ltd., August 2026–Present
- Four project cards: Emotion-Based Music Player; Online Exam Proctoring System; Tourism Planner/Location Recommendation App; Cloud-Based Music Recommendation System
- Certification: B10X AI Tools Certificate
- Downloadable PDF resume plus GitHub and LinkedIn links
- Contact form with client-side validation and backend storage workflow

3. Architecture, API & Database Design

The application uses a simple three-layer architecture. The frontend presents portfolio content and validates contact input. The Express backend exposes POST /api/contact, validates the request and communicates with MongoDB. The Contact collection stores name, email, subject, message, status and createdAt.

Request flow: Visitor → Contact form → Frontend validation → POST /api/contact → Express validation → MongoDB → Success response → Frontend confirmation.

4. Responsive Design & Usability

The interface follows the requested blue-and-white professional visual direction and uses a single responsive layout. CSS Grid/Flexbox are used for cards and sections. The navigation collapses into a mobile menu below 600px, project cards become single-column on small screens, and the layout adapts for tablet and desktop widths.

- Mobile target: below 600px
- Tablet target: 600–991px
- Desktop target: 992px and above
- Visible keyboard focus states and labelled form fields
- Readable typography, consistent spacing and accessible descriptive links

5. Testing Plan & Evidence

- Navigation links scroll to the correct sections
- Resume button opens the PDF resume
- Project repository links open the configured GitHub destination
- Empty/invalid contact submissions are rejected by validation
- Valid contact submission returns success when MongoDB is connected
- Database record contains the submitted message and timestamp
- Mobile, tablet and desktop layouts show no horizontal overflow
- Live frontend, API and HTTPS links are checked after deployment

6. Challenges & Learning Outcomes

The project brings together frontend structure, responsive styling, API design, validation, database modelling, Git/GitHub organisation and deployment preparation in one application. It reinforces how a browser form becomes a backend request and how validated data can be persisted in a database.

7. Deployment & Submission Status

The project source is prepared for deployment, with separate frontend and backend directories, environment-variable examples and a README. Actual public deployment and database evidence require the student's own hosting and MongoDB credentials, so live URLs and database screenshots must be added after deployment rather than being fabricated.

8. Conclusion & Future Improvements

The completed project provides a professional student portfolio foundation and a working full-stack contact architecture. Future improvements can include a CMS for projects, email notifications, richer project demos, analytics and a dedicated admin view for messages.
